AB Disclosed are ruthenium-phosphine-diamine complexes which are useful as catalysts for asym. hydrogenation, diamine ligands, and a process for highly stereoselectively producing optically active alcs. in high yield. The process comprises using a ruthenium compound represented by the general formula Ru(Px)n1[DIAMINE](X)(Y) [wherein Px represents a phosphine ligand; DIAMINE represents an optically active diamine represented by the general formula R1R2C*(NHR5)-(A)-R3R4C*(NH2) [wherein R1 to R4 each independently represents hydrogen, optionally substituted alkyl, alkenyl, cycloalkyl, aralkyl, or aryl; A represents optionally substituted C1-3 alkylene optionally containing an ether bond, optionally substituted C3-8 cycloalkylene, arylene, or divalent heterocyclic ring, or a single bond; R5 represents optionally substituted alkyl, optionally substituted aralkyl, or optionally substituted aryl; and C* represent s asym. carbon]; X and Y each independently represents an anion; and n1 is an integer of 1 or 2] as a catalyst for asym. hydrogenation to produce a β-amino alc. from an α-aminocarbonyl compound Thus, condensation of (1S,2S)-N-benzyloxycarbonyl-1,2-diphenyl-1,2-ethanediamine with 4-benzyloxybenzaldehyde in CHCl3 at room temperature for 19 h gave 84% (1S,2S)-N-(4-benzyloxybenzylidene)-N'-benzyloxycarbonyl-1,2-diphenyl-1,2-ethanediamine which underwent hydrogenation over 5% Pd-C in a 1:1 mixture of MeOH and THF (30 mL) at room temperature for 18 h to give 48% (1S,2S)-N-(4-hydroxybenzyl)-1,2-diphenyl-1,2-ethanediamine (I). Treatment of I with NaH in DMF at room temperature for 2 h followed by benzylation with benzyl bromide at room temperature for 4 h gave 53% (1S,2S)-N-(4-benzyloxybenzyl)-1,2-diphenyl-1,2-ethanediamine (II). [[(S)-tol-Binap]RuCl2](DMF)n [tol-Binap = 2,2'-bis[di(p-tolyl)phosphino]-1,1'-dinaphthyl] (5 mg), 2 mg II, 0.5 M Me3COK/2-propanol (0.3 mL), and a solution of 134 mg 1-phenyl-2-(N-methyl-N-benzoylamino)propan-1-one in 3 mL 2-propanol were added to an autoclave, degassed, and pressurized with H to 12 atm, and stirred at room temperature for 2 h to give 100% (1S,2S)-1-phenyl-2-(N-methyl-N-benzoylamino)-1-propanol (89% ee).

AB Umani-Ronchi-Savoin allylation is one of the most successful and useful methods for the preparation of optically pure secondary amines bearing two stereogenic centers at both α-positions. We have prepared novel chiral amine monomers by means of this methodol. as a key step of the synthesis. Diastereoselective allylation of chiral imines (3-5) derived from (S)-valine gave optically pure secondary amines 6. Hydrogenation of the allylic group followed by introduction of a polymerizable 4-vinylphenyl group led to enantiopure monomer 9. Prenylzinc reagents were also found to react with the imines to yield the corresponding optically pure amines 7. Since prenyl addition product does not inhibit the radical polymerization, chiral monomers 7b, 7d could be prepared directly by prenylzinc addition to imine having a polymerizable group. These chiral monomers were easily polymerized with styrene under radical polymerization conditions.

DT Journal

LA English

AB Following work with TAD-DOLs and BINOLs, we have now prepared Salen derivs. (2, 3, 14, 15, 18, 19, 20, 21) carrying two to eight styryl groups for crosslinking copolymn. with styrene. The Salen cores are either derived from (R,R)-diphenyl ethylene diamine (3, 15, 19, 21) or from (R,R)-cyclohexane diamine (2, 14, 18, 20). The styryl groups are attached to the salicylic aldehyde moieties, using Suzuki (cf. 1) or Sonogashira cross-coupling (cf. 11), and/or phenolic etherification (cf. 5, 7) with dendritic styryl-substituted Frechet-type benzylic branch bromides. Subsequent condensation with the diamines provides the chiral Salens. Corresponding Salens lacking the peripheral vinyl groups (cf. 12, 13, 16, 17) were also prepared for comparison of catalytic activities in homogeneous solution with those in polystyrene. Crosslinking radical suspension copolymn. of styrene and styryl Salens, following a procedure by Itsuno and Frechet, gave beads (ca. 400 μm diameter) which were loaded with Mn or Cr (ca. 0.2 mmol of complex per g of polymer), with more than 95% of the Salen incorporated being actually accessible for complexation (by elemental anal.). The polymer-bound Mn and Cr complexes were used as catalysts for epoxidns. of six phenyl-substituted olefins (m-CPBA/NMO; products 22a-f), and for dihydropyranone formation from the Danishefsky diene and aldehydes (PhCHO, C5H11CHO, C6H11CHO, products 23a-c). There are several remarkable features of the novel immobilized Salens: (i) The dendritic branches do not slow down the catalytic activity of the complexes in solution; (ii) the reactions with Salen catalysts incorporated in polystyrene give products of essentially the same enantiopurity as those observed in homogeneous solution with the dendritically substituted or

with the original Jacobsen-Katsuki complexes; (iii) some Mn-loaded beads have been stored for a year, without loss of activity; (iv) especially the biphenyl- and acetylene-linked Salen polymers (p-2, -3, -20, -21, Figure 2, 3) give Mn complexes of excellent performance: after ten uses (without re-charging with Mn!) there is no loss of enantioselectivity or degree of conversion under the standard conditions.

RL: RCT (Reactant); SPN (Synthetic preparation); PREP (Preparation); RACT (Reactant or reagent)
(crosslinking agent; preparation of dendritic and non-dendritic styryl-substituted salens)

IT **360785-10-0P**
RL: RCT (Reactant); SPN (Synthetic preparation); PREP (Preparation); RACT (Reactant or reagent)
(epoxidn. catalyst ligand; preparation of dendritic and non-dendritic styryl-substituted salens)

IT **360785-06-4P**
RL: SPN (Synthetic preparation); PREP (Preparation)
(epoxidn. catalyst ligand; preparation of dendritic and non-dendritic styryl-substituted salens)

IT **360785-06-4DP**, manganese complexes **360785-10-0DP**, manganese complexes
RL: CAT (Catalyst use); SPN (Synthetic preparation); PREP (Preparation); USES (Uses)
(epoxidn. catalyst; preparation of dendritic and non-dendritic styryl-substituted salen-crosslinked polystyrene Mn and Cr complexes and their use as catalysts in enantioselective epoxidns. and hetero-Diels-Alder reactions)

IT **360785-08-6P**
RL: RCT (Reactant); SPN (Synthetic preparation); PREP (Preparation); RACT (Reactant or reagent)
(crosslinking agent; preparation of dendritic and non-dendritic styryl-substituted salens)

RN 360785-08-6 HCAPLUS

CN Phenol, 2,2'-[[(1R,2R)-1,2-diphenyl-1,2-ethanediyl]bis[(Z)-nitrilomethylidyne]]bis[4-[[3,5-bis[(4-ethenylphenyl)methoxy]phenyl]methoxy]-6-(1,1-dimethylethyl)- (9CI) (CA INDEX NAME)

Absolute stereochemistry. Rotation (-).
Double bond geometry as shown.
